

## Nexalin Therapy is Medication-Free and is a Non-Invasive Treatment

*With Proven Effectiveness in Treating  
Anxiety, Depression, and Insomnia*

Functioning normally, your brain manufactures neurochemicals that keep your moods in a balanced state called homeostasis. Deep depression, mental trauma, high anxiety or chronic insomnia in any combination can throw this homeostasis out of control. To the sufferer, this seems permanent. But Nexalin effects a vitally important change.

With three pads placed gently on the patient's head (one on the forehead and one behind each ear), the Nexalin medical device uses a tiny, virtually undetectable waveform, to stimulate the deep centers of the brain. This helps to support normalized levels of neurochemicals, which regulate your body's homeostasis.

Called by various names, like Transcranial Electronic Stimulation (TES) or Cranial Electrotherapy Stimulator (CES), Nexalin technology represents a major medical breakthrough in alleviating anxiety, depression, and insomnia and other symptoms associated with these conditions.
